

The AI Learning Charter

An infinitely patient tutor that never sleeps. Used badly, it makes you feel like you are learning while you learn nothing.

USE AI FOR THIS

Explain code

"Explain this Python code line by line as if I'm a complete beginner: [paste code]"

Decode an error

"I got this error: [paste full error]. Here's my code: [paste]. Explain what went wrong in simple terms, then show the fix."

Analogy on demand

"Explain [concept] using a real-life analogy, no maths."

Quiz me

"Ask me 5 questions about [topic], one at a time. Tell me if my answer is right before the next one."

NEVER TRUST AI FOR THIS

Financial figures & statistics

LLMs invent numbers confidently — 'the market returned 11.3% in 2019'

Rule: Every number needs a source you can click

Citations & references

AI fabricates plausible-looking papers and URLs

Rule: If you can't open it, it doesn't exist

'Just give me the answer'

You'll pass the exercise and fail the capstone

Rule: Attempt first, AI second

Code you don't understand

Code that works for the wrong reason fails silently later

Rule: Only run AI code you can explain line by line

Financial advice

It doesn't know your situation, and this course is simulation

Rule: Never

The verify habit — three steps, every time

1. Ask AI for the code or explanation.
2. Interrogate: "What assumptions does this make? When would this be wrong?"
3. Verify on a case where you already know the answer.

The rule that matters most

you may only run AI-generated code you can explain line by line. You're allowed to use AI to reach that explanation, you're not allowed to skip it.

Disclosure: every exercise and the capstone carry one line — "AI assisted with ____" or "AI was not used." Not to punish use, to build the habit. In a real finance job, undisclosed AI use inside a model is a compliance incident.
